```

```
[1048]: 0    0.998273
        1    0.001727
        Name: Class, dtype: float64
```

```
[1071]: fig, ax = plt.subplots(figsize=(12,30))
        sns.countplot(ax=ax, x='Class', data=df)
```

```
[1071]: <matplotlib.axes._subplots.AxesSubplot at 0x1db86b5ce08>
```

Values for the minority class which indicate fraudulent transactions are **only 0.1727 % of the total data**. The fraud class bar on the barchart is **barely visible**. This is clearly a **SEVERLY IMBALANCED** dataset.

0.0.1 Data Visualisation in 2-dimensional space

```
[1054]: #For sampling, we will get all the samples from fraud class and only a fraction
        ↳ of legitimate transactions
        fraud_instances = len(df[df["Class"] == 1])
        fraud_data = df[df["Class"] == 1]
        legitimate_data = df[df["Class"] == 0]
        subset_legitimate_data = legitimate_data.sample(fraud_instances*12) #Only about
        ↳ 2% of legitimate transactions
        fraud_data.reset_index(drop=True, inplace=True)
        subset_legitimate_data.reset_index(drop=True, inplace=True)
        sample_data = pd.concat([fraud_data, subset_legitimate_data])

        X_visualization = sample_data.drop('Class', axis=1)
        y_visualization = sample_data['Class']

        #Applying the standard scaler that we are going to use later
        from sklearn.preprocessing import StandardScaler
        scaler = StandardScaler()

        X_visualization=scaler.fit_transform(X_visualization)
```

```
[1055]: #Run TSNE dimensionality reduction
        from sklearn.manifold import TSNE
        X_reduced_dim = TSNE(n_components=2, random_state=42).
        ↳ fit_transform(X_visualization)
```

```
[1056]: # t-SNE scatter plot
        import matplotlib.patches as mpatches

        f, ax = plt.subplots(figsize=(24,16))

        legitimate = mpatches.Patch(color='blue', label='Legitimate')
        fraudulent = mpatches.Patch(color='red', label='Fraudulent')

        ax.scatter(X_reduced_dim[:,0], X_reduced_dim[:,1], c=(y_visualization == 0),
        ↳ cmap='coolwarm', label='No Fraud', linewidths=2)
        ax.scatter(X_reduced_dim[:,0], X_reduced_dim[:,1], c=(y_visualization == 1),
        ↳ cmap='coolwarm', label='Fraud', linewidths=2)
```

```
ax.set_title('Visualizing the transformed CC Fraud Dataset', fontsize=14)

ax.grid(False)
ax.set_facecolor('w')

ax.legend(handles=[legitimate, fraudulent])
```

[1056]: <matplotlib.legend.Legend at 0x1dbda24b388>

Data Preprocessing

Let's drop the columns that have very little correlation

```
[1057]: df.drop(columns=['V22', 'V25', 'V26'], inplace=True, axis=1)
```

Convert the amount to log scale

```
[1058]: df['Amount'] = np.log(df['Amount'] + 0.001)
```

The number of minority class (positive) samples are very rare (only 492). While splitting the dataset, let us do it in a way that maintains the same class distribution in each subset. We will do it through **STRATIFIED SAMPLING** by using target variable to control the sampling process.

```
[1059]: #Class is the target variable
X=df.loc[:, df.columns != 'Class']
y=df[['Class']]
```

```
[1060]: X.shape, y.shape
```

```
[1060]: ((284807, 27), (284807, 1))
```

```
[1061]: # split into train/test sets with same class ratio
from sklearn.model_selection import train_test_split
trainX, testX, trainy, testy = train_test_split(X, y, test_size=0.3,
↳random_state=100,stratify=y)
```

```
[1062]: train_0, train_1 = len(trainy[trainy['Class']==0]),
↳len(trainy[trainy['Class']==1])
test_0, test_1 = len(testy[testy['Class']==0]), len(testy[testy['Class']==1])
print('Checking the Split -->Train: 0=%d, 1=%d, Test: 0=%d, 1=%d' % (train_0,
↳train_1, test_0, test_1))
```

Checking the Split -->Train: 0=199020, 1=344, Test: 0=85295, 1=148

Split looks good

One approach to addressing imbalanced datasets is to oversample the minority class. New examples can be synthesized from the existing examples. This is a type of data augmentation for the minority class and is referred to as the Synthetic Minority Oversampling Technique (**SMOTE**). We will use a variant of SMOTE based on Support Vector Machine(SVM) called **SVMSMOTE**

```
[1063]: from collections import Counter
```

```
[1064]: counter = Counter(trainy['Class'])
print(counter)
```

Counter({0: 199020, 1: 344})

```
[1065]: from sklearn.preprocessing import StandardScaler
scaler = StandardScaler()

trainX=scaler.fit_transform(trainX)
testX=scaler.transform(testX)
```

```
[1066]: from imblearn.over_sampling import SVMSMOTE
oversample = SVMSMOTE(sampling_strategy=1)
trainX_scaled, trainy_scaled = oversample.fit_resample(trainX, trainy)
counter = Counter(trainy_scaled['Class'])
```

```
[1067]: print(counter)
```

Counter({0: 199020, 1: 199020})

```
[1069]: fig, ax = plt.subplots(figsize=(12,12))
sns.countplot(ax=ax, x='Class',data=trainy_scaled)
```

```
[1069]: <matplotlib.axes._subplots.AxesSubplot at 0x1db86ab3108>
```

Oversized sampling has brought the size of minority class sample to one third of that of majority class.
